

Thesis Title Generation

You're right. Your current title describes a **software project/system**, whereas a thesis title should emphasize a **research problem, methodology, model, evaluation, or novel contribution**.

For your topic—**AI + education + dropout prediction + adaptive learning + Bangladesh**—I would recommend these thesis-style titles:

Strong Thesis Titles

1. "A Machine Learning Framework for Early Prediction of Student Dropout Risk and Personalized Learning in Bangladeshi Higher Education" ★
2. "Predictive Modeling of Student Dropout Risk and Adaptive Learning Recommendation Using Machine Learning: A Study of Bangladeshi Students"
3. "An Explainable Machine Learning Approach to Early Student Dropout Prediction and Personalized Learning Recommendation in Bangladesh" ★
4. "Data-Driven Early Identification of At-Risk Students and Personalized Learning Pathways in Bangladeshi Higher Education"
5. "A Predictive and Adaptive Learning Framework for Improving Student Retention in Bangladeshi Higher Education"
6. "Machine Learning-Based Student Retention Modeling with Adaptive Learning Recommendation: Evidence from Bangladesh"
7. "Early Prediction of Academic Dropout and Personalized Learning Recommendation Using Student Behavioral and Academic Data"
8. "An Explainable Predictive Framework for Student Dropout Risk Assessment and Adaptive Learning Recommendation"
9. "Intelligent Student Retention Through Machine Learning-Based Risk Prediction and Personalized Learning: A Bangladeshi Perspective"
10. "A Data-Driven Framework for Predicting Student Attrition and Recommending Personalized Learning Content in Higher Education"

My top 3 for a BSc CSE thesis

Best overall:

A Machine Learning Framework for Early Prediction of Student Dropout Risk and Personalized Learning in Bangladeshi Higher Education

More research-oriented:

An Explainable Machine Learning Approach to Early Student Dropout Prediction and Personalized Learning Recommendation in Bangladesh

More novel/academic:

A Predictive and Adaptive Learning Framework for Improving Student Retention in Bangladeshi Higher Education

Important difference

Instead of putting **MERN Stack / LMS / React / Node.js** in the thesis title, keep those as the **implementation technology** inside your methodology/project.

Your thesis can investigate:

Research Problem → Dataset → ML Models → Dropout Prediction → Explainability → Recommendation Algorithm → Evaluation → Bangladeshi Context

This makes it much easier to defend as a **research thesis rather than just an LMS project**.

If you want something **uncommon and publication-oriented**, I would choose **#3 (Explainable ML)** and build the research around *why* the model predicts a student as high-risk and *which learning intervention/content* should be recommended.
